

# Data Structures in C

Antonio Carzaniga

Faculty of Informatics  
Università della Svizzera italiana

March 9, 2015

# Outline

- Structures and unions
- Dynamic memory allocation

# Structures

# Structures

```
struct date {
    int year;
    int month;
    int day;
};
void print_date(const struct date * d);
int main() {
    struct date moon_landing;
    moon_landing.year = 1969;
    moon_landing.month = 7;
    moon_landing.day = 20;
    print_date(&moon_landing);
}
void print_date(const struct date * d) {
    printf("%d/%d/%d\n", d->day, d->month, d->year);
}
```

# Nested Structures

# Nested Structures

```
struct person {
    const char * name;
    struct date birthdate;
    struct person * mother;
    struct person * father;
};

void print_person(const struct person * p) {
    printf("Name: %s\n", p->name);
    printf("Birthdate: ");
    print_date(&(p->birthdate));
    printf("Mother's Name: %s\n", p->mother->name);
    printf("Father's Name: %s\n", p->father->name);
}
```

# Initializers for Structs and Arrays

# Initializers for Structs and Arrays

```
struct Person {  
    int age;  
    char * name;  
    struct Person * father;  
    struct Person * mother;  
};  
  
struct Person p = { 18, "Antonio", NULL, NULL };  
  
int moon_landing[3] = { 20, 7, 1969 };  
  
const char * Italia82[] = {  
    "Zoff", "Gentile", "Scirea",  
    "Collovati", "Bergomi", "Cabrini",  
    "Oriali", "Tardelli", "Conti",  
    "Graziani", "Rossi" };
```

# Enums and Unions

# Enums and Unions

```
enum Type { INTEGER, FLOAT, STR };

union Value {
    int int_value;
    float float_value;
    char * str_value;
};

enum read_value(union Value * v);

int main(int argc, char *argv[]) {
    union Value v;
    switch(read_value(&v)) {
        case INTEGER: printf("v=%d\n", v.int_value); break;
        case FLOAT: printf("v=%f\n", v.float_value); break;
        case STR: printf("v=%s\n", v.str_value); break;
    }
}
```

# More on Unions

You must always read the last element you write

# More on Unions

You must always read the last element you write

```
union Value {
    int int_value;
    float float_value;
    char * str_value;
};

int main(int argc, char *argv[]) {
    union Value v;
    v.str_value = "ciao";
    v.int_value = 100;
    printf("v = %s\n", v.str_value); /* undefined behavior! */
}
```

# More on Unions

- The point is to share memory space
  - ▶ with mutually-exclusive values

# More on Unions

- The point is to share memory space
  - ▶ with mutually-exclusive values

```
union Value {
    int int_value;
    float float_value;
    char * str_value;
};
struct MValue {
    int int_value;
    float float_value;
    char * str_value;
};
printf("union: %d bytes, struct: %d bytes\n",
       sizeof(union Value), sizeof(struct MValue));
```

# Dynamic Memory Allocation

- The standard C library provides functions for the allocation and deallocation of memory
  - ▶ crucially important feature
  - ▶ basic concepts and functions are very simple
  - ▶ correct use requires complete comprehension and attention to details

# Dynamic Memory Allocation

- The standard C library provides functions for the allocation and deallocation of memory
  - ▶ crucially important feature
  - ▶ basic concepts and functions are very simple
  - ▶ correct use requires complete comprehension and attention to details
- Use `malloc` to allocate memory

```
char * copy_string(const char * s) {  
    char * c, res;  
    if (res = malloc(strlen(s) + 1))  
        for (c = res; (*c = *s) != 0; ++s, ++c);  
    return res;  
}
```

# The sizeof Operator

- Memory allocation functions take a *size* parameter
  - ▶ size in bytes
- The sizeof operators tells the size of a given type

```
struct Person {
    int age;
    char * name;
    struct Person * father;
    struct Person * mother; };
struct Person * reproduction(struct Person * mom,
                             struct Person * dad) {
    struct Person * child;
    = (struct Person *)malloc(sizeof(struct Person));
    if (child != 0) {
        child->age = 0; child->name = choose_name();
        child->mother = mom; child->father = dad; }
    return child; }
```

# Dynamic Memory Allocation

- Use free to deallocate memory

```
char * x = copy_string("ciao!");  
if (x != NULL) {  
    /* ... */;  
    free(x);  
} else {  
    printf("no more memory!\n");  
}
```

# Dynamic Memory Allocation

- Use free to deallocate memory

```
char * x = copy_string("ciao!");  
if (x != NULL) {  
    /* ... */  
    free(x);  
} else {  
    printf("no more memory!\n");  
}
```

- A pointer value is no longer valid after the use of free

```
char * x = copy_string("ciao!");  
free(x);  
printf("%s", x); /* use of invalid pointer! */
```

# Exercise

- Implement a “radix-256” tree to represent a set of strings

# Exercise

- Every element of the data structure has 256 pointers to the next characters
- Implement *insertion* and *search* functions

## Exercise (2)

- Parameters: name of a file containing a list of (less than 1000) entries representing persons

## Exercise (2)

- Parameters: name of a file containing a list of (less than 1000) entries representing persons
  - ▶ format: one entry per line:  
16/12/1969,Mario Rossi,Alberto Rossi,Diana Bianchi

## Exercise (2)

- Parameters: name of a file containing a list of (less than 1000) entries representing persons
  - ▶ format: one entry per line:  
16/12/1969,Mario Rossi,Alberto Rossi,Diana Bianchi
- Input: a set of names, one per line

## Exercise (2)

- Parameters: name of a file containing a list of (less than 1000) entries representing persons
  - ▶ format: one entry per line:  
16/12/1969,Mario Rossi,Alberto Rossi,Diana Bianchi
- Input: a set of names, one per line
- Output: if the name was found in the list, outputs the person's year of birth and all the names of his/her ancestors
  - ▶ first-level ancestors should be identified as “madre” and “padre”
  - ▶ second-level ancestors should be “nonna” and “nonno”
  - ▶ third-level ancestors should be “bisnonna” and “bisnonno”
  - ▶ fourth-level ancestors should be “bisbisnonna” and “bisbisnonno”
  - ▶ ...

## Exercise (2)

### ■ Example output

```
% ./genealogy data
Input name:  Mario Rossi
born in 1969
madre:  Diana Bianchi
padre:  Alberto Rossi
nonna:  Celeste Verdi
nonno:  Piero Bianchi
nonna:  Maria Villa
nonno:  Piero Rossi
...
Input name:
```
